

Shared visibility across **your airside operation.**

Many handlers and tenants work one apron. ThruFly is designed to give airport operations a shared, timestamped record of turnaround activity, without adding work for the crews doing it.

What you are dealing with

- Many handlers, each with its own procedures and records
- Documentation assembled after the aircraft has gone
- Little live view of what is happening on the apron

Metrics we would propose

- Procedure step completion
- Time from issue to log
- Completeness of records for safety or delay reviews
- Crew adoption

What ThruFly is designed to give you

- One timestamped record that every handler's crews write to
- Completed checklists and verifications you can open for a review
- Issues logged by crews at the moment they are found

How a pilot would run

- Start with one handler or one group of gates
- Your operations sponsor and the handler agree what gets recorded before day one
- Nothing to connect to your airport systems to start

One handler or group of gates. Agreed metrics. One or two turnaround procedures, 60 to 90 days, with metrics agreed up front. Your data remains yours. Ownership, retention and exit terms are agreed in writing before a pilot begins. ThruFly runs on its own, so no integration into your systems is needed to start.
